Geologic Application of  
Thermal-inertia Mapping from Satellite

Type II Progress Report  
September - November 1979

(E80-10050) GEOLOGIC APPLICATION OF  
THERMAL-INERTIA MAPPING FROM SATELLITE  
Progress Report, Sep. - Nov. 1979  
(Geological Survey) 20 p HC A02/MF A01

N80-16398

Unclas  
CSCL 08B G3/43 00050

Prepared for  
Goddard Space Flight Center  
Greenbelt, Maryland 20771

Submitted by  
Terry W. Offield, Principal Investigator  
U.S. Geological Survey, Denver, Colorado 80225

Prepared by  
Susanne H. Miller and Kenneth Watson  
U.S. Geological Survey, Denver, Colorado 80225

**A. Problems**

None

**B. Accomplishments**

The two USGS aircraft scenes which were processed to thermal-inertia images (Progress Reports March - May 1979 and June - August 1979) were concatenated into one image. A contrast stretch was applied to the resulting image to emphasize the thermal property differences. This product is now available to be compared with a thermal-inertia map produced from HCMM data when appropriate data are available. (See the data utility section.)

During this last reporting period, twelve CCT's were received. Each of the data sets have been reformatted to be compatible with the USGS computer. One 36 hour day/night pair of the Cabeza Prieta area appears to have stable meteorological conditions between acquisition times. The nighttime data is presently being registered to the daytime. The list of HCMM products received to date has been updated since the last reporting period.

**C. Significant Results**

None

**D. Publications and Presentations**

Ken Watson submitted an abstract for the International Geological Congress titled "Regional geologic analysis from HCMM thermal satellite data". "Ground support data July 10 to July 29, 1979, for the HCMM thermal satellite over the Powder River Basin, Wyoming" is in review to be published as a USGS open-file report.

**E. Recommendations**

None

**F. Funds Expended**

Total expenditures to date: \$81,838

**G. Data Utility**

For the Powder River Basin we have received two day/night pairs. The 30 July pair looks anomalous; GOES and NOAA-5 data for this same day confirms the presence of a thin cloud layer over the area. The 5 September data consists of a clear nighttime image and 50% cloud-covered daytime images. Neither of these two data sets are particularly acceptable. If a better day/night pair is not found, one of the above mentioned data sets will be used for the final analysis.

For the Cabeza Prieta site, three day/night pairs have been received: one 84 hour pair, one 60 hour pair, and one 36 hour pair. The 36 hour pair appears to be acceptable.
